CC comprising an N-terminal 6His tag, the human p27 protein W3

C comprising an N-terminal 6His tag, the human p27 protein (see

CC AAY96066), a (Gly4Ser)3 hinge, and the human p16 protein (see

CC AAY96067). The fusion protein is encoded by a nucleic acid (see

CC AAY96067). The fusion protein is encoded by a nucleic acid (see

CC AAY96067). The fusion protein is encoded by a nucleic acid (see

CC AAA960523) that was obtained by PCR amplification of human p27 and p16

CC DNAS using primers that also included codons encoding the tag/hinge

CC regions of the fusion protein. A claimed method for inhibiting

CC anglogenesis involves transducing an epithelial cell with a

CC ransgene encoding a cell dependent kinase inhibitor (CDKi). The

CC delivery system for the transgene is a liposome or a recombinant

CC virus. The CDK i is a protein of the CIP/KIP family such as p27, a

CC protein of the INK4 family such as p16, active fragments of these

CC proteins, or a fusion of 2 CDKi proteins such as p27 and p16. The

CC method is useful in treating conditions associated with angiogenesis,

CC such as neoplasia, rheumatoid arthritis, endometriosis, psoriasis

CC and vascular retinopathy (claimed). Alternatively, the transgene

CC is delivered to an auxiliary cell, and is expressed by that cell

CC condition, CDK2/cyclinA and CDK2/cyclinE and inhibit cell cycle

CC condition, CDK2/cyclinA and CDK2/cyclinE and inhibit cell cycle

The DNA encoding CC this sequence is joined to a promoter functional in eukaryotic cells and used in the expression construct of the invention. p16 is an inhibitory subunit, which is involved in the control of cyclin-dependent kinase 4 activity, and functions as a tumour suppressor. By detecting this sequence or the DNA encoding it, cancer cells can be detected. When the nucleic acid molecule is in the sense orientation, the expression construct can be used to restore p16 function in a cell, particularly by reversing the transformed phenotype in tumours, especially lung or bladder cancer or melanoma. It may also have anti-angiogenic activity, and inhibit hyperproliferative disorders, e.g. restenosis. When the nucleic acid molecule is inserted in the antisense orientation, the carpession construct inhibits p16 function. Reduced or increased levels of p16, or a related nucleic acid, may be diagnostic of tumours, e.g. by containing the containing t

                                                                                                                                                                                                                                          can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of MTS. Recombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein itself may also be used to restore MTS function in a cell.
                                                                                                                                                                                                                                                                                                        This is the amino acid sequence of the multiple tumour suppressor 1 (MTS-1) protein, used in the method of the invention. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These

The sequence is homologous to the corresponding murine gene. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, predispose towards malignancies such as melanoma, leukaemia,

The protein has a cytostatic activity and is used in protein replacement therapy. MTS1 is useful in diagnosing human cancers such as (ocular) melanoma, leukemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, multiple myeloma, sarcoma, myosarcoma, cholangiocarcinoma, squamous cell carcinoma, CLL, and cancers of pancreas, breast, stomach, brain, prostate, bladder, thyroid, ovary, uterus, testis, kidney, colon and rectum. The MTS1 gene and protein is
          Human; chimeric cyclin dependent kinase inhibitor; CDKi; therapy; adenovirus E4 protein; neoplasia; p16 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a protein composition comprising a novel purified chimeric cyclin dependent kinase inhibitor (CDKi) and a purified adenovirus E4 protein. The compositions comprising the protein or the DNA encoding it are useful for treating neoplasias in animals. T compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of human p16, a cyclin dependent CC kinase inhibitor (CDKI) that inhibits smooth muscle cell CC proliferation. A claimed method for inhibiting smooth muscle cell coll proliferation involves transducing smooth muscle cells with a CC replication-deficient recombinant adenovirus that lacks a functional CC El region and a functional E4 region, and comprises a transgene CC encoding a CDKI. The CDKI is selected from an INK4 family protein Such as human p16, a CIP/KIP family protein such as p27, active fragments of these, or fusion proteins comprising (active fragments of these, or fusion proteins comprising (active fragments CC and AAY96049). The method is used to inhibit mammalian smooth muscle C cell hyperproliferation induced by injury caused by angioplasty, C stent placement or vein engraftment. It is useful for treating to constitutions of the companion of the cell indicated by angioplasty.

                                                                                                                                                                                                                                                                                                                                          The present sequence is that of human p16, a cyclin dependent kinase inhibitor (CDKi) that inhibits angiogenesis. A claimed method for inhibiting angiogenesis involves transducing an epithelial cell with a transgene encoding (internalizable, secretable) CDKi. The delivery system for the transgene may be a liposome or a recombinant virus. The CDKi is preferably a protein of the CIP/KIP family such as p27, a protein of the INK4 family such as p16, active fragments of these proteins, or a fusion of 2 CDKi proteins such as p27 and p16 (see AAY96068-80). The method is useful in treating conditions associated with angiogenesis, e.g.

The variants have the following changes relative to the wild type coding sequence: A at any of positions 265, 442, 330 and 329; T at any of positions 172, 238, 341 and 148 and deletions of nucleotides 290-294, 172-179 or 128-129. The variants are somatic mutations of MST1, indicative of predisposition to melanoma and many other cancers, so detecting them is useful for diagnosis, prognosis and monitoring of cancer (including prenatal analysis). Cells and animals that express the variants are useful as model systems for

                                                                                                                                                                                                                                                                                                                                                                                       stomach and used in the
                                                                                                                                                                                                                                                                                                                                                                                                  product is not rully nunchanged in the useful as a model system to study cancer remission and drug treatment which promotes such remission. The present invention relates to somatic mutations and germ line mutations in the MTS gene and their use in the diagnosis and prognosis of human cancer e.g. melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a vector (I) comprising an isolated DNA sequence of a multiple tumour suppressor (MTS) gene having a polynucleotide sequence of the human MTSIEI-beta. (I) is useful for introducing wild-type MTS function to a cancerous or pre-cancerous cell which carries diminished or mutant MTS alleles for suppressing neoplastic growth of the recipient cells. (I) is also useful for increasing the level of expression of MTS gene even in tumour cells in which the mutant gene is expressed at a normal level but the gene product is not fully functional. A host cell transformed with (I) is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      unuan; multiple tumour suppressor; MTS; somatic mutation; diagnosis; germ line mutation; gene therapy; cytostatic; m leukaemia; astrocytoma; glioblastoma; Lymphoma; glioma; Hodgkin's lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        suppressor gene -

                                                                                              This sequence represents the human MTS1 protein.

CC The invention relates to a method for diagnosing a polymorphism cc associated with a predisposition to cancer by detecting a germ-line cc associated with a predisposition to cancer by detecting a germ-line cc associated with a predisposition to cancer by detecting a gene or its carperssion products in a human sample. The method comprises detecting a cc germ-line alteration of a wild-type MTS gene or its expression products cc in a human sample, the alteration indicating a predisposition to at least cone of the cancers. The cancer is selected from melanoma, leukaemia, cc astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, cc chronic lymphocytic leukaemia (CLL), and cancers of the pancreas, breast, ct thyroid, ovary, uterus, testis, kidney, stomach and rectum. The method cc may be used as the basis for developing very important diagnostic testis capable of predicting the predisposition to cancer. The MTS gene is compable of predicting the predisposition to cancer. The MTS gene is compable of predicting the predisposition to cancer. The MTS gene is compable of predicting the predisposition to cancer. The MTS gene is compable of predicting the predisposition to cancer. The MTS gene is compable of predicting the predisposition to cancer. The MTS gene is compable of predicting the predisposition to cancer. The MTS gene is compable of predicting the predisposition to cancer. The MTS gene is compable of predicting the predisposition to cancer. The MTS gene is compable of predicting the predisposition to cancer. The MTS gene is considered the many provide in the progression of multiple tumour types and may provide compable of predicting the predisposition to cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          18-MAR-1994;

                                                                                                                                                                                                This sequence represents the human multiple tumour suppressor 1 (MTS1) protein. The invention relates to the human MTS2 DNA and protein sequences. The DNA sequences are useful for diagnosing or determining a predisposition to cancers e.g. melanoma, leukaemia, lymphoma, glioma, Hodgkin's lymphoma and cancers of the pancreas, breast, thyroid, ovary, bidge, with the pancreas of the pancreas of the pancreas.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence represents the amino acid sequence of human multiple tumour suppressor MTS1. The MTS genes, and expression products, are useful for treating, diagnosing or prognosing human cancer. In particular, the MTS gene is useful for diagnosing a predisposition to or as a gene therapy for melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, chronic lymphatic leukaemia (CLL), or cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach or rectum. The gene may be used in both cancerous and pre-cancerous cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; multiple tumour suppressor; MTS1; MTS2; therapeutic; cancer; gene therapy; melanoma; leukaemia; astrocytoma; glic lymphoma; glioma; Hodgkin's lymphoma; chronic lymphatic leukaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New mouse multiple tumour suppressor gene, useful for diagnosing or prognosing human cancer or as gene therapy for treating cancer, particularly melanoma, leukemia, astrocytoma, lymphoma or cancers of the pancreas or breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Stone S,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      03-APR-2001

                                                                                                                                                                                                                                                                                multiple tumour suppressor (MTS) gene in human cancer. The invention also relates to therapy of human cancer which have a mutation in the MTS gene, including gene therapy, protein replacement therapy, and protein mimetics. The MTS sequences are useful for diagnosing predisposition to human cancer or for diagnosing and prognosing human cancers such as melanoma, leukaemia, astrocytoma, glioblastoma human cancers such as melanoma, leukaemia, astrocytoma, glioblastoma

                                                                                                                                                                                                specifically binds to a human multiple tumour suppressor (MTS). The invention is useful for detecting differences in the absence of MTS peptides, to screen a tissue or to detect mutant MTS gene products. The antibodies will immunoprecipitate MTS proteins from solution as well as react with MTS protein on Western or immunoblots of polyacrylamide gels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               MTS;

The invention relates to a protein composition comprising a novel purified chimeric cyclin dependent kinase inhibitor (CDK1) and a purified adenovirus E4 protein. The compositions comprising the protein, or the DNA encoding it are useful for treating neoplasias in animals. The compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays to synchronise cell growth in cultured cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protein and nucleic acid compositions for preventing and treating neoplasias (particularly cancer), comprises a novel chimeric cyclependent kinase inhibitor and adenovirus E4 protein -

                                                                                                                                                                                                                                                                                                                                                                                     dependent kinase inhibitor (CDKI) domain is retained, and human place protein (see AAY96053), with no (GJy4Ser)3 hinge. A claimed method CC for inhibiting smooth muscle cell hyperproliferation involves CC transducing smooth muscle cells with a replication-deficient CC comprises a transgene encoding a CDKI. The CDKI is selected from CC an INK4 family protein such as human pl6, a CIP/KIP family protein CC comprising (active fragments of these, or fusion protein and a CC CIP/KIP family protein (see AAY96046 and AAY96049). A fusion protein comprising W9 is specifically claimed. The method is used to inhibit mammalian smooth muscle cell hyperproliferation induced CC by injury caused by angioplasty, stent placement or vein CC centraftment. It is useful for treating vascular pathologies e.g., CC CIP/KIP ife and to elaimed are recombinant lentiviruses encoding CC CDKis. Use of truncated p27 was designed to increase the protein's CC in the negative regulation of CDKi activity. The p27-p16 fusion CC CDKIS interact with the CDK4/cyclinA and conversion at
                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-MAR-1999;

            The present sequence is that of fusion protein W9 comprising an XY -terminal truncated human p27 protein (see AAY96075) in which only Ct the cell dependent kinase inhibitory (CDKi) domain was retained, and a human p16 protein (see AAY9607). This version of W9 differs from that of AAY96076 by the lack of a hæmag9lutinin tag. A C claimed method for inhibiting angiogenesis involves transducing an CC epithelial cell with a transgene encoding a CDKi. The transgene conclusion of the CIP/KIP family such as p27, a protein of the CIP/KIP family such as p27, a protein of the CIP/KIP family such as p27, a protein comprising 2 C CINK4 family such as p16, active fragments of these (e.g. amino acids C 5-93 or 12-178 of human p27), or a fusion protein comprising 2 C CDKi proteins such as (truncated) p27 and p16 (see AAY96068-80). A C method is used to treat conditions associated with angiogenesis, method is used to treat conditions associated with angiogenesis, constitutions the comprision of the contraction of the conditions associated with angiogenesis and constitutions associated with angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-MAR-1999;

The invention relates to novel inhibitors of cyclin-dependent kinases (CDKs), particularly CDK/cyclin complexes. It provides a recombinant transfection system (A) that comprises: (i) first gene construct comprising a sequence encoding an inhibitory polypeptide containing a least one CDK-binding motif for binding and inhibiting activity of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cyclin-dependent kinase; CDK; CDK/cyclin complex; inhibitory; restenosis; CDK-binding motif; endothelialisation; fusion protein; therapeutic; acne; intracellular; transcytosis; vascular wound; repair; hair; smooth muscle; cardiovascular; arteriosclerotic; fibrotic disorder; cellular proliferation; rheumatoid arthritis; diabetes; cirrhosis; graff;
                                                                                                                                                                                                                                                           Fusion and chimaeric proteins including cyclin-dependent kinase binding motif - used for regulation of cell proliferation and differentiation, for treatment of, e.g. vascular injury, cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               delivered to an auxiliary cell, and is expressed by that cell such that the CDKi is released into the blood and contacts the target epithelial cell. Use of truncated p27 was designed to increase the protein's half-life and to eliminate potential phosphorylation sites involved in the negative regulation of CDKi activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 25-MAY-1999

Also provided are nucleic acids encoding a fusion protein (FP) containing: (i) a therapeutic polypeptide sequence (TP) from an intracellular protein that alters a cellular process when FP enters the cell, and (ii) a transcellular polypeptide sequence (TCP) that promotes transcytosis of FP. The FP consists of at least one CDK-binding motif and a TCP. See AAX26220 for detailed uses of the recombinant transfection system. The present sequence represents a human truncated p27/pl6 fusion protein.
                                                          Protein and nucleic acid compositions for preventing and tree neoplasias (particularly cancer), comprises a novel chimeric dependent kinase inhibitor and adenovirus E4 protein -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             purified chimeric cyclin dependent kinase inhibitor (CDKi) and a purified adenovirus E4 protein. The compositions comprising the protein, or the DNA encoding it are useful for treating neoplasias in animals. The compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays to synchronise cell growth in cultured cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC haemagglutinin tag, a truncated human p27 protein comprising a CC haemagglutinin tag, a truncated human p27 protein (see AAY96048) in CC which only the cyclin dependent kinase inhibitor (CDKi) domain is CC retained; and human p16 protein (see AAY96053). A claimed method for CC inhibiting smooth muscle cell hyperproliferation involves CC transducing smooth muscle cells with a replication-deficient CC comprises a transgene encoding a CDKI. The CDKI is selected from CC comprises a transgene encoding a CDKI. The CDKI is selected from CC comprising (active fragments of these, or fusion protein and CC comprising (active fragments of these, or fusion protein accomprising way is specifically claimed. The method is used to CC pyKIP family protein (see AAY96046 and AAY96049). A fusion protein CC comprising way is specifically claimed. The method is used to CC pyinjury caused by angioplasty, stent placement or vein CC engraftment. It is useful for treating vascular pathologies e.g., CC restenosis. Also claimed are recombinant lentiviruses encoding CC bhis. Use of truncated p27 was designed to increase the protein's CC half-life and to eliminate potential phosphorylation sites involved in the negative regulation of CDKI activity. The p27-p16 fusion CC CDK2/cyclinA and CC CDK2/cyclinA complexes and inhibit cell cycle progression at multiple points.

                                                                                                      ρ
                                                                                                                                                                                                                                                CC N-terminal haemagglutinin tag, a truncated human p27 protein (see CAY96075) in which only the cell dependent kinase inhibitory domain CC was retained, and a human p16 protein (see AAY96067). A claimed method CC for inhibiting angiogenesis involves transducing an epithelial cell with a transgene encoding a cyclin dependent kinase inhibitor (CDKi). CC The delivery system is a liposome or a recombinant virus. The CDKi CC is a protein of the CIP/KIP family such as p27, a protein of the CZ (CINA) family such as p16, active fragments of these (e.g. amino acids C2 5-93 or 12-178 of human p27), or a fusion protein comprising 2 CC (DKi proteins such as (truncated) p27 and p16 (see AAY96068-80). A CC method in which the CDKi is w9 is specifically claimed. The CC method is used to treat conditions associated with angiogenesis, CC e.g. neoplassia, rheumatoid arthritis, endometriosis, psoriasis and CC vascular retinopathy (claimed). Alternatively, the transgene is CC delivered to an auxiliary cell, and is expressed by that cell such CC that the CDKi is released into the blood and contacts the target CC epithelial cell. Use of truncated p27 was designed to increase the CCC involved in the negative regulation of CDKi activity.

                                                                                                                                                                                                                                                                                         CC (CDKs), particularly CDK/cyclin comprises: (1) first gene construct
CC transfection system (A) that comprises: (1) first gene construct
CC comprising a sequence encoding an inhibitory polypeptide containing at
CC comprising a sequence encoding an inhibitory polypeptide containing at
CC comprising a sequence encoding and inhibiting activity of a
CC (EX, linked to a transcription regulator functional in eukaryotic cells;
CC (ii) second gene construct comprising a sequence encoding a polypeptide
CC that promotes endothelialisation, and (iii) a gene delivery composition
CC for delivering the GCs to a cell for transfection. Also provided are
CC nucleic acids encoding a fusion protein (FP) containing: (i) a
CC therapeutic polypeptide sequence (TP) from an intracellular protein that
CC alters a cellular process when FP enters the cell, and (ii) a
CC transcellular polypeptide sequence (TP) that promotes transcytosis of
CC encosists of at least one CDK-binding motif and a TCP. See
CC AAX26220 for detailed uses of the recombinant transfection system. The
CC present sequence represents a human truncated p27/p16 fusion protein.
                                                                                                                                                                                                        Matches 121;

                                                                                                                                                                                                                                                                                                 This sequence represents the human W10 protein. The invention relates to a protein composition comprising a novel purified chimeric cyclin dependent kinase inhibitor (CDKi) and a purified adenovirus E4 protein. The compositions comprising the protein, or the DNA encoding it are useful for treating neoplasias in animals. The compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays to synchronise cell growth in cultured cells.

cc claimed, a (1945er) 3 hinge, and human p16 protein (see AAY96053). A cc claimed method for inhibiting smooth muscle cell hyperproliferation convicus transducing smooth muscle cells with a replication-deficient recombinant adenovirus that lacks functional E1 and E4 regions, and comprises a transgene encoding a CDK1. The CDK1 is selected from the comprises a transgene encoding a CDK1. The CDK1 is selected from the comprise of the comprise of the comprise of the comprising (active fragments of these, or fusion protein and a CIPKIP family protein (see AAY96046 and AAY96049). The method is used to inhibit mammalian smooth muscle cell hyperproliferation induced by injury caused by angioplasty, stent placement or vein the surface of truncated p27 was designed to increase the protein's comprise of truncated p27 was designed to increase the protein's chalf-life and to eliminate potential phosphorylation sites involved in the negative regulation of CDK1 activity. The p27-p16 fusion control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cyclin depen p16; human; vasotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-MAR-1999;

CC N-terminal haemagglutinin tag, a truncated human p27 protein (see AAY96075) in which only the cyclin dependent kinase inhibotry domain CC is retained, a (Gly4Ser)3 hinge, and human p16 protein (see AAY96067). CC A claimed method for inhibiting angiogenesis involves transducing an CC epithelial cell with a transgene encoding a cyclin dependent kinase cc inhibitor (CDKi). The delivery system is a liposome or a recombinant CC virus. The CDKi is a protein of the CIP/KIP family such as p27, a CC protein of the INK4 family such as p16, active fragments of these CC (e.g. amino acids 25-93 or 12-178 of human p27), or a fusion protein CC comprising 2 CDKi proteins such as (truncated) p27 and p16 (see CC AAY96068-80). The method is used to treat conditions associated with CC angiogenesis, e.g. neoplasia, rheumatoid arthritis, endometriosis, CC psoriasis and vascular retinopathy (claimed). Alternatively, the CC transgene is delivered to an auxiliary cell, and is expressed by CC transgene is delivered to an auxiliary cell, and is expressed by CC confacts the target epithelial cell. Use of truncated p27 was CC designed to increase the protein's half-life and to eliminate CC potential phosphorylation sites involved in the negative CC regulation of CDKi activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (See AAY96075) in which only the cyclin dependent kinase inhibitor (CDKi) domain is retained, and the human p16 protein (see AAY96067).

A claimed method for inhibiting angiogenesis involves transducing an epithelial cell with a transgene encoding a CDKi. The delivery system is a liposome or a recombinant virus. The CDKi is a protein of the CIP/KIP family such as p27, a protein of the CIP/KIP family such as p27, a protein of the CIP/KIP family such as p27, a protein of the CIP/KIP family such as p27, a protein of the comprising 2 CDKi proteins such as (truncated) p27 and p16 (see CAAY96068-80). A method in which the CDKi is w9 is specifically claimed. The method is used to treat conditions associated with angiogenesis, e.g. neoplasia, rheumatoid arthritis, endometriosis, psoriasis and vascular retinopathy (claimed). Alternatively, the transgene is delivered to an auxiliary cell, and is expressed by that cell such that the CDKi is released into the blood and contacts the target epithelial cell. Use of truncated p27 was designed to increase the protein's half-life and to eliminate protein a contential phosphorylation sites involved in the negative
                                                                                                                                                                                                                                                                                                                                                                                                                             tches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-MAR-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel inhibitors of cyclin-dependent kinases (CDKs), particularly CDK/cyclin complexes. It provides a recombinant transfection system (A) that comprises: (i) first gene construct transfection system (A) that comprises: (i) first gene construct comprising a sequence encoding an inhibitory polypeptide containing at least one CDK-binding motif for binding and inhibiting activity of a CDK, linked to a transcription regulator functional in eukaryotic cells: (ii) second gene construct comprising a sequence encoding a polypeptide that promotes endothelialisation, and (iii) a gene delivery composition for delivering the GCs to a cicl, and (iii) a gene delivery composition concleic acids encoding a fusion protein (FP) containing: (i) a therapeutic polypeptide sequence (TP) from an intracellular protein that alters a cellular process when FP enters the cell, and (ii) a transcellular polypeptide sequence (TCP) that promotes transcytosis of FP. The FP consists of at least one CDK-binding motif and a TCP. See present sequence represents a buman transcated 277716 fixed a containing that the combinant transfection system. The

The compositions comprising the protein, or the DNA encoding it are useful for treating neoplasias in animals. The compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays to

N-terminal haemagglutinin tag, a truncated human p27 protein (see AAY96072) in which the first 12 N-terminal and the final 21 C-terminal amino acids of full-length p27 (see AAY96066) are deleted, and a C-terminal human p16 protein (see AAY96067). A claimed method for inhibiting angiogenesis involves transducing an epithelial cell with a transgene encoding a cyclin dependent kinase inhibitor (CDKi). The delivery system is a liposome or a recombinant virus. The CDKi

The method is used to treat conditions associated with angiogenesis, e.g. neoplasia, rheumatoid arthritis, endometriosis, psoriasis and vascular retinopathy (claimed). Alternatively, the transgene is delivered to an auxiliary cell, and is expressed by that cell such that the CDK1 is released into the blood and contacts the target epithelial cell. Use of truncated p27 was designed to increase the protein's half-life and to eliminate potential phosphorylation sites involved in the negative regulation of CDK1 activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fusion gene; CDK inhibitor; cyclin-dependant kinase; p27 gene; p16 gene; chimeric polypeptide; human; binding motif; proliferation control; cell differentiation; cell-cycle inhibitor; proliferative disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cc chimeric polypeptides of the invention have cyclin-dependent kinase (CDK) cc binding motifs from at least two different proteins that bind to CDKs. CC Particularly they inhibit cell-cycle progression. They can be used to cc treat a wide range of proliferative disorders, e.g. cancer, leukaemia, cc psoriasis, atherosclerosis, restenosis, chronic inflammation etc. They can also treat diseases associated with de-differentiation or they cc degeneration of tissue, e.g. Alzheimer's, Parkinson's or Huntington's cc diseases, gastric ulcers and autonomous diseases of the peripheral cc nervous system. Other applications include reducing growth of hair and protecting hair follicle cells against cytotoxic treatments, cosmetically to treat various forms of folliculatis, and to inhibit spermatogenesis or cogenesis. The chimeric proteins can also be used in vitro to maintain cc cells, especially neurons intended for testing specific activity of trophic factors, at selected points in the cell cycle. The proteins are more active inhibitors of the CDK/Cyclin complex than binding motifs used individually (since they may bind to CDK involved in different stages of the CBH cycle.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comprising a sequence encoding an inhibitory polypeptide containing at least one CDK-binding motif for binding and inhibiting activity of a CDK, linked to a transcription regulator functional in eukaryotic cells; (ii) second gene construct comprising a sequence encoding a polypeptide that promotes endothelialisation, and (iii) a gene delivery composition for delivering the GCs to a cell for transfection. Also provided are nucleic acids encoding a fusion protein (FP) containing: (i) a therapeutic polypeptide sequence (TP) from an intracellular protein that alters a cellular process when FP enters the cell, and (ii) a transcellular polypeptide sequence (TCP) that promotes transcytosis of FP. The FP consists of at least one CDK-binding motif and a TCP. See AXX26220 for detailed uses of the recombinant transfection system. The

It provides a recombinant CC transfection system (A) that comprises: (i) first gene construct CC comprising a sequence encoding an inhibitory polypeptide containing at CCC comprising a sequence encoding an inhibitory polypeptide containing at CCC CDK. linked to a transcription regulator functional in eukaryotic cells; CCC ii) second gene construct comprising a sequence encoding a polypeptide CCC that promotes endothelialisation, and (iii) a gene delivery composition CCC for delivering the GCs to a cell for transfection. Also provided are CCC uncleic acids encoding a fusion protein (FP) containing: (i) a CCC therapeutic polypeptide sequence (PP) from an intracellular protein that CCC transcellular process when FP enters the cell, and (ii) a CCC transcellular polypeptide sequence (TCC) that promotes transcytosis of CCC transcellular polypeptide sequence (TCC) that promotes transcytosis of CCC transcellular polypeptide sequence (TCC) that promotes transcytosis of CCC transcellular polypeptide sequence (TCC) that promotes transcytosis of CCC transcellular polypeptide sequence (TCC) that promotes transcytosis of CCC transcellular polypeptide sequence (TCC) that promotes transcytosis of CCC transcellular polypeptide sequence (TCC) that promotes transcytosis of CCC transcellular polypeptide sequence (TCC) that promotes transcytosis of CCC transcellular polypeptide sequence (TCC) that promotes transcytosis of the recombinant transfection system. The CCC transcellular polypeptide sequence (TCC) that promotes transcytosis of the recombinant transfection system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a protein composition comprising a novel purified chimeric cyclin dependent kinase inhibitor (CDKi) and a purified adenovirus E4 protein. The compositions comprising the protein, or the DNA encoding it are useful for treating neoplasias in animals. The compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays to synchronise cell growth in cultured cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein and nucleic acid compositions for preventing and treating neoplasias (particularly cancer), comprises a novel chimeric cyclin dependent kinase inhibitor and adenovirus E4 protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       08-APR-1999;

                                                                                                                                                                                                                                                                   05-DEC-2000
                                                                                                                                                                                                                                                                                          AAY96042;
                                                                                                                                                                                                                                                                                                                AAY96042 standard; Protein; 365 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the human W6 protein. The invention relates to a protein composition comprising a novel purified chimeric cyclin dependent kinase inhibitor (CDKi) and a purified adenovirus E4 protein. The compositions comprising the protein, or the DNA encoding it are useful for treating neoplasias in animals. The compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays to synchronise cell growth in cultured cells.
                                                                                                                                                                                                                                            Antiproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein and nucleic acid compositions for preventing and treating neoplasias (particularly cancer), comprises a novel chimeric cyclin dependent kinase inhibitor and adenovirus E4 protein -

                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of p27-p16 fusion protein W4 comprising CC an N-terminal haemagilutinin tag, the human p27 protein (see AAY96052), CC and the human p16 protein (see AAY96053), with no (G194Ser)3 hinge. CC It is encoded by a nucleic acid obtained by PCR amplification of p27 CC and p16 DNAs. A claimed method for inhibiting smooth muscle cell hyperproliferation involves transducing smooth muscle cells with a CC replication-deficient recombinant adenovirus that lacks functional CC large proteins, and comprises a transgene encoding a cyclin CC dependent kinase inhibitor (CDK1). The CDK1 is selected from an CC INK4 family protein such as human p16, a CIP/KIP family protein CC comprising (active fragments of these, or fusion proteins and CC CIP/KIP family protein (see AAY96046 and AAY96049). The method is used CC CIP/KIP family protein such muscle cell hyperproliferation, induced by injury caused by angioplasty, stent placement or vein crestenessis. Also claimed are recombinant lentiviruses encoding

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US-09-016-869B-35
148
1 MEPSADWLATAAARGRVEEV.....TRGSNHARIDAAEGPSDIPD 148

Scoring table: OLIGO Gapop 60.0 , Gapext 60.0

Searched: 105224 seqs, 38719550 residues

size : 0

Total number of hits satisfying chosen parameters: 105224

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Listing first 75 summaries

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
